

Inigo Quilez :: articles :: breakpoint 2007 - tricks and techniques for rgba's past and future intros

The last two years have been very busy, and I didn't have the time to make any intro. Yet I developed some techniques that work well enough to be used in 64k intros, so better share them just in case :) This presentation at breakpoint explained some of these techniques, and also older techniques used in the past. It also contains a bit of the making-off our two best known intros.

It covers:

- general demo hardcoding
- procedural textures
- procedural modeling
- procedural animation
- ambient occlusion computation
- mesh compression
- mesh collashing
- cloth simulation
- mesh skinning and bone animation
- catmull clark subdivision

Grab the presentation [here](#).

You can also get some accompanying videos:

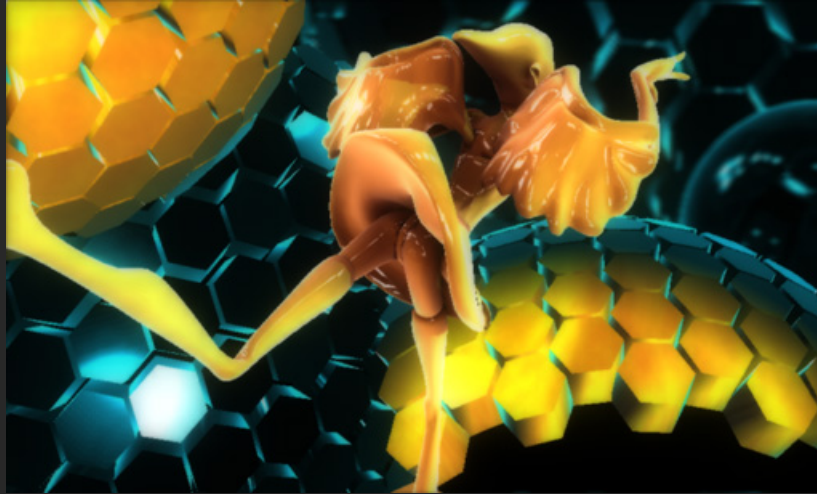

[cloth simulation 1](#). Simple spring mass simulation.

[cloth simulation 2](#). Plus one sphere collision detection.

[cloth simulation 3](#). Plus four spheres and some cosine driven translations applied on them.

[cloth simulation 4](#). Simple mesh as cloth seed, plus few thousands spheres generated from the skeleton for

realtime collision.
